ABSTRACT OF THE DISCLOSURE

A semiconductor light emitting device comprises: a substrate; an n-type layer provided on the substrate and made of a nitride semiconductor material; a multiple quantum well structure active layer including a plurality of well layers each made of In_zGa_(1-z-y)Al_yN (0≤x, 0≤y, x+y<1) and a plurality of barrier layers each made of In_zGa_(1-z-y)Al_zN (0≤x, 0≤y, x+y<1) structure active layer being provided on the n-type layer; and a p-type layer provided on the multiple quantum well structure active layer and made of a nitride semiconductor material. The p-type layer contains hydrogen, and the hydrogen concentration of the p-type layer is greater than or equal to about 1×10¹⁶ atoms/cm³ and less than or equal to about 1×10¹⁹ atoms/cm³.
